

DEFENSE & MILITARY ORGANIZATIONS

Military and defense organizations are obliged to put in place both proactive and defensive measures to protect information systems and data. In addition, there is a requirement to maintain exceptionally high standards of reliability.

NETASQ products are uniquely approved to EU RESTRICTED and NATO Restricted standards, as well as Level EAL4+ International Common Criteria V3.1.

TRUSTED PRODUCTS

Defense agencies require particular guarantees that sensitive information can be adequately protected against security breaches.

NETASQ products are uniquely approved to EU RESTRICTED and NATO Restricted standards, as well as Level EAL4+ international common criteria V3.1. NETASQ is also the first firewall vendor to achieve French government approval for its VPN encryption services. This unparalleled suite of certifications guarantees that they meet the rigorous specifications required by military and defense agencies.

You therefore have peace of mind that your most sensitive military information is protected, and the reassurance that your investment in the future development of new technologies is secure.

PROTECTION

Defense organizations cannot afford to suffer loss of confidential data and the subsequent leakage of important information. All internal applications and general documentation should be securely protected, in addition to including strong encryption for confidential communications.

The NETASQ intrusion prevention engine is based on many years of research and delivers optimal levels of security. NETASQ uniquely combines both protocol analysis and signature protection to ensure proactive defense against attack and real Zero-Day protection. The level of certification recognizes it as one of the most powerful on the market and ensures a high level of security and, by design, a high level of performance.

In addition, NETASQ solutions offer a whole range of features allowing easy administration, ease of use and deployment.

CENTRALIZED MANAGEMENT

IT infrastructure continues to evolve and the number of remote sites is growing. The consequent proliferation of remote security equipment on your networks is accompanied by a significant administrative overhead. A centralized approach to management and administration enables your IT Support to respond to these developments and optimize security across the network.

The NETASQ Administration Suite is a complete solution that simplifies the management of the entire network. It enables you to ensure you have optimal security on a daily basis, through a centrally managed process.

EASE OF INTEGRATION

It is extremely difficult to integrate a new security solution into any pre-existing network architecture. The risk of network corruption and general disruption is high, particularly in the absence of any centralized application.

NETASQ products incorporate a range of features to ensure simple integration into existing networks. Flexible Network Layer technology and modular security combine to ensure there is no disruption of end user functionality. Support for routed mode, transparent and hybrid network layer based on FreeBSD delivers flexible integration with complex architectures. Integrated routing capabilities enable easy connection to your existing network.

DEFENSIVE COMPUTING

Defense networks demand the highest levels of network security. Your networks require the necessary management functionality to prevent breaches and guarantee the protection of military secrets.

NETASQ Vulnerability Manager's real-time scanning solution offers integrated intrusion prevention. Fully integrated in the heart of the operating engine, it provides real-time information on any infrastructure threats. NETASQ Vulnerability Manager allows you to have complete control of your architecture, giving you full overview of critical vulnerabilities in a timely manner.

DEDICATED SERVICES

Your defense organization faces particular requirements when establishing security policies and constraints which govern internal processes for securing configuration and other changes.

NETASQ offers a range of specialist services for such sensitive markets. These include the ability to perform secure data exchange and deploy secure configurations using a USB key. In addition, equipment not directly connected to the Internet can also be updated automatically thanks to NETASQ's offline, system update.

About NETASQ

With over 75,000 unified threat management firewalls deployed to business, government and defence organisations of all sizes, NETASQ delivers solutions of unrivalled performance, protection and control and the most comprehensive EU and NATO certifications of any firewall.
