

MANAGED SECURITY SERVICES PROVIDERS

Managed Security Services Providers (MSSPs) have to develop service offerings which bring added value to their customers. They may deploy security solutions on client sites or manage them centrally with automatic updating.

NETASQ helps you to manage your entire network and reduce operational costs by deploying comprehensive network security functionality in a single appliance.

KEYWORDS

- Intrusion Prevention (IPS)
- Quality of Service (QoS)
- Vulnerability
- Authentication
- Antivirus

NETASQ products are uniquely approved to EU RESTRICTED and NATO Restricted standards, as well as Level EAL4+ International Common Criteria V3.1.

OPERATIONAL COSTS

Operational costs are a constant concern for service providers. Without simple intuitive management tools, you are unable to minimize operator intervention and to carry out central configuration and maintenance.

NETASQ equipment is designed to provide you with management tools and automatic reporting to facilitate user, SLA and security reporting. Real-time network management allows you to monitor each client network. A single CLI interface delivers remote control of all aspects of security including firewalls, intrusion prevention, VPN IPSEC, SSL, antivirus, antispam and URL filters. Network robustness is also supported by high availability options and disk redundancy.

SIMPLIFIED ADMINISTRATION

Operational teams are faced with many new challenges. IT infrastructure continues to evolve as the number of remote sites, many without dedicated IT support, increases and screening of remote networks is a growing requirement. The ever-growing number of security appliances on your network is accompanied by a significant administrative overhead. A centralized approach to management and deployment of automatically-updating products enables your IT Support to respond to these developments and optimize security across the network.

The NETASQ Administration Suite is a complete solution that delivers monitoring and reporting for the entire network. Thanks to a centrally managed process which gives you complete control, you can limit access rights and roles for remote administrators on your customer networks. Extensive reporting capabilities enable you to view any modifications applied by administrators and to receive accurate site-by-site reports on alarms, connections and bandwidth management information.

BREADTH OF FUNCTIONALITY

As networks grow in complexity you are faced with increasing workload and costs. The addition of more network devices means a greater management overhead and higher risk of disruption to service.

NETASQ's comprehensive UTM approach to network security products enables you to simplify your service offering. In a single easily upgraded device NETASQ provides a firewall, an IPS for intrusion prevention, a web filter module, antispam, antivirus, IPSEC interconnect functions and a complete VPN SSL server. This makes it easy for you to offer the right response to every customer security concern.

MARKETING

Your marketing initiatives need to combine the easy implementation of generic configurations for large-scale deployment with the activation of on-demand services for

more targeted product offerings. They must be supported by a range of management services including monitoring, update schedules, licensing, and centralized administration and reporting.

NETASQ gives you the configuration control you need to develop your own service offerings with sharply-focused products. On-demand customer services can be easily activated.

SUPPORT/TRAINING

You need the same level of reliable, dependable support that you provide to your customers. It should be responsive, with dedicated contacts to ensure your customer issues are dealt with quickly and effectively.

NETASQ's operator support gives you access to a 24/7 multilingual service desk with dedicated contacts and monthly progress sessions. All support contracts also include access to customized training sessions and NETASQ appliances to support you in developing your client services.

ADDED VALUE

A good reputation is paramount in such a competitive market. Your service offering is your value-add and NETASQ can help to differentiate you from your competition.

NETASQ Vulnerability Manager is a unique, real-time tool which passively analyses your customers' networks. It audits PCs, Operating Systems and services and gives the administrator relevant information on the level of risks throughout the network. This allows the operator to evaluate the importance of any alarm highlighting imminent threats. Alerts and comprehensive reporting provide a full overview of critical vulnerabilities and help to identify what actions you can take to reduce risk levels in a timely manner.

About NETASQ

With over 75,000 unified threat management firewalls deployed to business, government and defence organisations of all sizes, NETASQ delivers solutions of unrivalled performance, protection and control and the most comprehensive EU and NATO certifications of any firewall.
